HACKATHON

GCC Edition

Team Name : Lagom

Team Leader Name : RAJANAND ILANGO VAN

Team Size : 1

Problem Statement : Five supply-chain systems compute the same KPIs differently – this project builds a governed Semantic View so every team gets one trustworthy answer.

Submission Guidelines:

(Things to add on the submission deck)

1. Problem Brief

- What real business problem does this solve?
- Who is the target user/persona?
- What is the current pain point and how does this improve it?
- Industry/domain context

2. Architecture Diagram

- System design showing data flow
- Which CoCo CLI skills are used and how they connect
- Data sources (structured/unstructured)
- How modular components plug together

3. Impact Statement

- Measurable outcomes (time saved, accuracy improvement, etc.)
- Scalability potential
- How this extends beyond the demo

Problem Brief

What real business problem does this solve?

Supply chain data is scattered across ERP, TMS, Supplier Portal, IoT sensor, and Finance systems, each computing the same KPI differently. Ask “what’s our On-Time Delivery rate?” and four systems give four different, individually defensible answers (89.4% / 91.3% / 78.6% / a biased IoT sample) – there is no shared source of truth.

Current pain point → how this improves it

Today each team’s number is “correct” by its own definition, so leadership can’t trust cross-team reporting. This project encodes ONE governed definition per metric as a native Snowflake Semantic View – every persona now gets the identical number (64.875% OTD), verified regardless of how the question is worded.

Who is the target user / persona?

Planning, Procurement, and Logistics analysts inside a Global Capability Center who all report the same supply-chain KPIs upward, but pull them from different source systems using different, undocumented definitions.

Industry / domain context

Manufacturing / industrial supply chain — Supplier → Part → Plant → Shipment → Order → Customer, the exact entity chain called out in the challenge brief. 100% synthetic data; no proprietary or real GCC data used anywhere in the project.

Architecture Diagram

CoCo CLI skills used

Built end-to-end with CoCo CLI across 8 dated planning sessions (2026-09-12 → 09-23, committed under `.snowflake/cortex/plans/` and `.cortex/plans/`): `sql-author` for the medallion SQL, `agent-studio` for the Semantic View, `developing-with-streamlit-in-snowflake` for the app, and `verification skills` for the golden-question test suite.

Data sources

Structured: ERP orders, TMS deliveries, Supplier Portal shipments/POs, IoT sensor tracking events, Finance COGS/overhead.
Unstructured: 11 synthetic supplier contract PDFs, parsed via `AI_PARSE_DOCUMENT` and indexed in Cortex Search.

How components plug together

Each medallion layer is its own set of Dynamic Tables (`TARGET_LAG`-scheduled). The Semantic View is the single governed interface on top; the agent router (4 sub-agents behind a 5-intent classifier) and the Streamlit app both consume only that interface.

Impact Statement

Measurable outcomes

- 4 conflicting legacy answers (89.4% / 91.3% / 78.6% / biased) collapse into 1 governed number: 64.875%.
- 100% entity resolution across 4 independent systems (800/800 shipments matched).
- Cross-persona proof: 3 differently-worded questions → identical value + identical base_table/measure_name.

Scalability potential

- 28 Dynamic Tables, TARGET_LAG-scheduled — the pipeline scales with data volume, no manual reconciliation.
- Least-privilege RBAC split (SUPPLY_CHAIN_ANALYST_RO) is negative-tested and ready for enterprise rollout.
- The Semantic View pattern extends to new source systems or metrics without touching the agents or the app.

Beyond the demo

- The multi-agent pattern (what-if simulation, root-cause trace, document Q&A) is domain-agnostic — reusable for any governed-analytics use case.
- Marketplace enrichment (free Pelmorex weather data) proves the pattern for pulling in third-party signals.
- Disclosed roadmap (MCP connectors, Task automation, a packaged CoCo skill) is the explicit productionization path, not a hidden gap.
